

Ciria Report C660 Earlyage Thermal Crack Control In Concrete WORK

[Download](#)

Measures are available to minimize or prevent shrinkage cracking, ie select binders to slow down hydration and allow time for heat to dissipate. The use of a patented hydraulic tool to facilitate and simplify the process of pouring into molds and so that it is better pressed against the mold. Significant acceleration of the filling process due to the use of more flexible hydraulic equipment, as well as more comfortable discs. Physiology of hardening Reinforced concrete products are subject to sufficiently significant shrinkage deformation under the influence of the environment, so it is necessary to prevent and eliminate this shrinkage in a compressed state. This is mainly achieved by using the softest and most elastic aggregates. Reinforced concrete is the most common type of building material available through the local trading community. Fashion for such material has not yet appeared. However, however, it is quite popular. There are the following deformation processes, which are typical only for reinforced concrete: - shrinkage under the influence of sedimentation of the soil. - deformation of the structure during operation as a result of uneven sedimentation in the bulk part of the structure. Compressive shrinkage caused by exposure to moisture can be practically zero if groundwater is sufficiently far from the surface and its level is significantly lower than in the compressible elementary volume. In order to reduce shrinkage stresses, the molds must be thoroughly moistened before pouring, and vice versa, they should not be moistened too much. To do this, use special solutions and additives (such as cement-sand and cement-water). The advantage of using these additives is to increase the resistance of concrete. Shrinkage deformation of a maximum duration of 4 mm/m is usually allowed. Recommendations - in order to minimize the presence of shrinkage stresses in a compressed state during pouring, use concrete products of a certain shape and with certain internal dimensions. The correct application of the form, the choice of design ensures that the structural elements will retain their shape. To avoid possible cracking during shrinkage at an ambient temperature of 1C and below, the following points must be observed: - when using a form with seams to connect elements, it is necessary to select concrete in the direction of the seams. This selection is carried out using a jackhammer. If it is planned to install reinforced mesh on reinforced concrete products, it is recommended to scorch it with hair dryers
